PREFACE

The following tables comprise Part II of the American Practical Navigator, by the late Nathaniel Bowditch, LL. D., as revised in 1880 and in 1903, and again in 1914, under the direction of the Bureau of Navigation, Navy Department.

In the present edition, as in that of 1914, former tables 28A, 28B, 28C, and 28D, Latitude by Polaris; 37, Logarithms for Equal Altitude Sights; 37A, Equation of Equal Altitudes near Noon, have been omitted; but the former assignment of table numbers and page numbers has not been disturbed, the pages on which these tables were printed being simply dropped from the book and the tables and pages not renumbered consecutively. This accounts for the absence of pages 717 to 724 and 734 to 738, both inclusive; while page 531 is left blank in order to let Table 2 begin on a left-hand page.

HYDROGRAPHIC OFFICE,

Washington, D. C., April, 1916.

CONTENTS OF PART II.

		Page.
Explanation of the Tables		507
Table 1.	Traverse Table, Quarter Points	515
2.	Traverse Table, Degrees	531
3.	Meridional Parts	621
4.	Length of Degrees of Latitude and Longitude	629
5A.	Distance of an Object by Two Bearings, Quarter Points	631
5B.	Distance of an Object by Two Bearings, Degrees	634
6.	Distance of Visibility of Objects of different Heights	640
7.	Conversion of Arc and Time	641
8.	Conversion of Sidereal into Mean Solar Time	642
9.	Conversion of Mean Solar into Sidereal Time	645
10.	Local mean time of Sun's visible Rising and Setting	648
11.	Reduction of Moon's Meridian Passage for Longitude	672
12.	Reduction of Quantities from Nautical Almanac	673
13.	Change of Sun's Right Ascension	683
14.	Dip of Sea Horizon	685
15.	Dip at Distances short of Horizon	685
16.	Parallax of Sun	685
17.	Parallax of Planet	686
18.	Augmentation of Moon's Semidiameter	687
19.	Augmentation of Moon's Horizontal Parallax	687
20A.	Mean Refraction	688
20B.	Mean Refraction and Parallax of Sun	689
21.	Correction of Refraction for Barometer	690
22.	Correction of Refraction for Thermometer	691
23.	Mean Refraction and Mean Parallax of Moon	693
24.	Mean Refraction and Parallax of Moon	693
25.	Variation of Altitude due to change of Declination	702
26.	Variation of Altitude in one minute from Meridian	704
27.	Variation of Altitude in given time from Meridian	714
28A. 28B. 28C. 28D.	Omitted.	
29.	Nautical and Statute Miles	725
30.	Conversion of Metric and English Linear Measure	726
31.	Fahrenheit, Centigrade, and Réaumur Temperatures	727
32.	True Force and Direction of Wind	728
33.	Distance by Vertical Angle	729
34.	Distance by Horizon Angle	731
35.	Speed Table for Measured Mile	732
36.	Local Mean and Standard Meridian Times	733
37. 37A.	Omitted.	
38.	Error in Longitude produced by Error in Latitude	739
39.	Amplitudes	740
40.	Correction for Amplitude observed in Apparent Horizon	745
41.	Natural Sines and Cosines	746
42.	Logarithms of Numbers	755
43.	Logarithms of Trigonometric Functions, Quarter Points	771
44.	Logarithms of Trigonometric Functions, Degrees	772
45.	Logarithmic and Natural Haversines	817
46.	Consolidated table of Altitude Corrections	922
47.	The Longitude Factor	938
48.	The Latitude Factor	941

EXPLANATION OF THE TABLES.

TABLES 1, 2: TRAVERSE TABLES.

Tables 1 and 2 were originally calculated by the natural sines taken from the fourth edition of Sherwin's Logarithms, which were previously examined, by differences; when the proof sheets of the first edition were examined the numbers were again calculated by the natural sines in the second edition of Hutton's Logarithms; and if any difference was found, the numbers were calculated a third time by Taylor's Logarithms.

The first table contains the difference of latitude and departure corresponding to distances not exceeding 300 miles, and for courses to every quarter point of the compass. Table 2 is of the same nature, but for courses consisting of whole degrees; it was originally of the same extent as Table 1, but has been extended to include distances up to 600 miles. The manner of using these tables is particularly explained under the different problems of Plane, Middle Latitude, and Mercator Sailing in Chapter V.

The tables may be employed in the solution of any right triangle.

TABLE 3: MERIDIONAL PARTS.

This table contains the meridional parts, or increased latitudes, for every degree and minute to 80°, calculated by the following formula:

$$m = \frac{a}{M} \log \tan\left(45° + \frac{L}{2}\right) - a\,(e^2 \sin L + \tfrac{1}{3} e^4 \sin^3 L + \tfrac{1}{5} e^6 \sin^5 L + \ldots),$$

in which

the Equatorial radius $a = \frac{10800'}{\pi} = 3437'.74677$ (log 3.5362739);

M, the modulus of common logarithms = 0.4342945;

$\frac{1}{M} = 2.3025851$ (log 0.3622157);

C, the *compression* or meridional eccentricity of the earth

according to Clarke (1880) $= \frac{1}{293.465} = 0.003407562$ (log 7.5324437);

$e = \sqrt{2c - c^2} = 0.0824846$ (log 8.9163666);

from which

$\frac{a}{M} = 7915'.7044558$ (log 3.8984895);

$ae^2 = 23'.38871$ (log 1.3690072);

$\frac{1}{3}ae^4 = 0'.053042$ (log 8.7246192);

$\frac{1}{5}ae^6 = 0'.000216523$ (log 6.3355038).

The results are tabulated to one decimal place, which is sufficient for the ordinary problems of navigation.

The practical application of this table is illustrated in Chapters II and V, in articles treating of the Mercator Chart and Mercator Sailing.

TABLE 4: LENGTH OF DEGREES OF LATITUDE AND LONGITUDE.

This table gives the length of a degree in both latitude and longitude at each parallel of latitude on the earth's surface, in nautical and statute miles and in meters, based upon Clarke's value (1866) of the earth's compression, $\frac{1}{299.15}$. In the case of latitude, the length relates to an arc of which the given degree is the center.

TABLES 5A, 5B: DISTANCE BY TWO BEARINGS.

These tables have been calculated to facilitate the operation of finding the distance from an object by two bearings from a given distance run and course. In Table 5A the arguments are given in points, in Table 5B in degrees; the first column contains the multiplier of the distance run to give the distance of observed object at second bearing; the second, at time of passing abeam.

The method is explained in article 143, Chapter IV.

TABLE 6: DISTANCE OF VISIBILITY OF OBJECTS.

This table contains the distances, in nautical and statute miles, at which any object is visible at sea. It is calculated by the formulæ:

$$d = 1.15\sqrt{x}, \text{ and } d' = 1.32\sqrt{x},$$

in which d is the distance in nautical miles, d' the distance in statute miles, and x the height of the eye or the object in feet.

To find the distance of visibility of an object, the distance given by the table corresponding to its height should be added to that corresponding to the height of the observer's eye.

EXAMPLE: Required the distance of visibility of an object 420 feet high, the observer being at an elevation of 15 feet.

Dist. corresponding to 420 feet,	23.5 naut. miles.
Dist. corresponding to 15 feet,	4.4 naut. miles.
Dist. of visibility,	27.9 naut. miles.

TABLE 7: CONVERSION OF ARC AND TIME.

In the first column of each pair in this table are contained angular measures expressed in arc (degrees, minutes, or seconds), and in the second column the corresponding angles expressed in time (hours, minutes, or seconds). As will be seen from the headings of columns, the time corresponding to degrees (°) is given in hours and minutes; to minutes of arc (′), in minutes and seconds of time; and to seconds of arc (″), in seconds and sixtieths of a second of time.

The table will be especially convenient in dealing with longitude and hour angle. The method of its employment is best illustrated by examples.

EXAMPLE I.

Required the time corresponding to 50° 31′ 21″.

50°	00′	00″	= 3ʰ	20ᵐ	00ˢ
	31	00	=	2	04
		21	=		1.4
50	31	21	= 3	22	05.4

EXAMPLE II.

Required the arc corresponding to 6ʰ 33ᵐ 26ˢ.5.

6ʰ	32ᵐ	00ˢ	= 98°	00′	00″
	1	24	=	21	00
		2.5	=		37.5
6	33	26.5	= 98	21	37.5

TABLES 8 AND 9: SIDEREAL AND MEAN SOLAR TIMES.

These tables give, respectively, the reductions necessary to convert intervals of sidereal time into those of mean solar time, and intervals of mean solar into those of sidereal time. The reduction for any interval is found by entering with the number of hours at the top and the number of minutes at the side, adding the reduction for seconds as given in the margin.

The relations between mean solar and sidereal time intervals, and the methods of conversion of these times, are given in articles 289–291, Chapter IX.

TABLE 10: SUN'S RISING AND SETTING.

This table gives the local mean time of the sun's visible rising and setting—that is, of the appearance and disappearance of the sun's upper limb in the unobstructed horizon of a person whose eye is 15 feet above the level of the earth's surface, the atmospheric conditions being normal.

The local apparent times of rising and setting were determined from the formula for a time sight, the altitude employed being −0° 56′ 08″, made up of the following terms: Refraction, −36′ 29″; semi-diameter, −16′ 00″; dip, −3′ 48″; and parallax, 9″.

To ascertain the time of rising or setting for any given date and place, enter the table with the latitude and declination, interpolating if the degrees are not even. In the line R will be found the time of rising; in the line S, the time of setting. Be careful to choose the page in which the latitude is of the correct name, and in which the "approximate date" corresponds, nearly or exactly, with the given date.

This table is computed with the intention that, if accuracy is desired, it will be entered with the declination as an argument—not the date—as it is impossible to construct any table based upon dates whose application shall be general to all years. But as a given degree of declination will, in the majority of years, fall upon the date given in the table as the "approximate date," and as, when it does not do so, it can never be more than one day removed therefrom, it will answer, where a slight inaccuracy may be admitted, to enter the table with the date as an argument, thus avoiding the necessity of ascertaining the declination.

EXAMPLE: Find the local mean time of sunset at Rio de Janeiro, Brazil (lat. 22° 54′ S., long. 43° 10′ W.), on January 1, 1903 (dec. 23° 04′ S.).

Exact method.

Lat. 22°) Dec. 23°)	6ʰ 48ᵐ
Corr. for + 54′ lat	+ 02
Corr. for + 04′ dec	00
L. M. T. sunset	6 50

Approximate method.

Lat. 22°) January 2)	6ʰ 48ᵐ
Corr. for + 54′ lat	+ 02
Corr. for 1 day	− 01
L. M. T. sunset	6 49

TABLE 11: REDUCTION FOR MOON'S TRANSIT.

This table was calculated by proportioning the daily variation of the time of the moon's passing the meridian.

The numbers taken from the table are to be added to the Greenwich time of moon's transit in west longitude, but subtracted in east longitude.

TABLE 12: REDUCTIONS FOR NAUTICAL ALMANAC.

This is a table of proportional parts for finding the variation of the sun's right ascension or declination, or of the equation of time, in any number of minutes of time, the horary motion being given at the top of the page in seconds, and the number of minutes of time in the side column; also for finding the variation of the moon's declination or right ascension in any number of seconds of time, the motion in one minute being given at the top, and the numbers in the side column being taken for seconds.

TABLE 13: CHANGE OF SUN'S RIGHT ASCENSION.

This is a table that may be employed for finding the change of the sun's right ascension for any given number of hours, the hourly change, as taken from the Nautical Almanac, being given in the marginal columns.

TABLE 14: DIP OF SEA HORIZON.

This table contains the dip of the sea horizon, calculated by the formula:

$$D = 58''.8 \sqrt{F},$$

in which F = height of the eye above the level of the sea in feet.

It is explained in article 300, Chapter X.

TABLE 15: DIP SHORT OF HORIZON.

This table contains the dip for various distances and heights, calculated by the formula:

$$D = \frac{3}{7} d + 0.56514 \times \frac{h}{d},$$

in which D represents the dip in miles or minutes, d, the distance of the land in sea miles, and h, the height of the eye of the observer in feet.

TABLE 16: PARALLAX OF SUN.

This table contains the sun's parallax in altitude calculated by the formula:

$$\text{par.} = \sin z \times 8''.75,$$

in which z = apparent zenith distance, the sun's horizontal parallax being 8″.75.

It is explained in article 304, Chapter X.

TABLE 17: PARALLAX OF PLANET.

Parallax in altitude of a planet is found by entering at the top with the planet's horizontal parallax, and at the side with the altitude.

TABLE 18: AUGMENTATION OF MOON'S SEMIDIAMETER.

This table gives the augmentation of the moon's semidiameter calculated by the formula:

$$x = c\, s^2 \sin h + \tfrac{1}{2}\, c^2\, s^3 \sin^2 h + \tfrac{1}{2}\, c^2\, s^3,$$

where h = moon's apparent altitude;
s = moon's horizontal semidiameter;
x = augmentation of semidiameter for altitude h; and
$\log c = 5.2502$.

TABLE 19: AUGMENTATION OF MOON'S HORIZONTAL PARALLAX.

This table contains the augmentation of the moon's horizontal parallax, or the correction to reduce the moon's equatorial horizontal parallax to that point of the earth's axis which lies in the vertical of the observer in any given latitude; it is computed by the formula:

$$\triangle \pi = \pi (b - 1), \qquad b = \frac{1}{\sqrt{(1 - e^2 \sin^2 L)}},$$

where π = equatorial horizontal parallax;
L = latitude;
e = eccentricity of the meridian; $\log e^2 = 7.81602$; and
$\triangle \pi$ = augmentation of the horizontal parallax for the latitude L

TABLE 20A: MEAN REFRACTION.

This table gives the refraction, reduced from Bessel's tables, for a mean atmospheric condition in which the barometer is 30.00 inches, and thermometer 50° Fahr.

TABLE 20B: MEAN REFRACTION AND PARALLAX OF SUN.

This table contains the correction to be applied to the sun's apparent altitude for mean refraction and parallax, being a combination of the quantities for the altitudes given in Tables 16 and 20A.

TABLES 21, 22: CORRECTIONS OF REFRACTION FOR BAROMETER AND THERMOMETER.

These are deduced from Bessel's tables. The method of their employment will be evident.

TABLE 23: MEAN REFRACTION AND MEAN PARALLAX OF MOON.

This table contains the correction of the moon's altitude for refraction and parallax corresponding to the mean refraction (Table 20A), and a horizontal parallax of the mean value of 57′ 30″.

TABLE 24: MEAN REFRACTION AND PARALLAX OF MOON.

This table contains the correction to be applied to the moon's apparent altitude for each minute of horizontal parallax, and for every 10′ of altitude from 5°, with height of barometer 30.00 inches, and thermometer 50° Fahr.

For seconds of parallax, enter the table abreast the approximate correction and find the seconds of horizontal parallax, the tens of seconds at the side and the units at the top. Under the latter and opposite the former will be the seconds to add to the correction.

For minutes of altitude, take the seconds from the extreme right of the page, and apply them as there directed.

TABLE 25: CHANGE OF ALTITUDE DUE TO CHANGE OF DECLINATION.

This table gives the variation of the altitude of any heavenly body arising from a change of 100″ in the declination. It is useful for finding the equation of equal altitudes by the approximate method explained in article 324, Chapter XI, and for other purposes.

If the change move the body toward the elevated pole, apply the correction to the altitude with the signs in the table; otherwise change the signs.

TABLE 26: CHANGE OF ALTITUDE IN ONE MINUTE FROM MERIDIAN.

This table gives the variation of the altitude of any heavenly body, for one minute of time from meridian passage, for latitudes up to 60°, declinations to 63°, and altitudes between 6° and 86°. It is based upon the method set forth in article 334, Chapter XII, and the values may be computed by the formula:

$$a = \frac{1''.9635 \cos \mathrm{L} \cos d}{\sin (\mathrm{L} - d)},$$

where a = variation of altitude in one minute from meridian,

L = latitude, and

d = declination—positive for same name and negative for opposite name to latitude at upper transit, and negative for same name at lower transit.

The limits of the table take in all values of latitude, declination, and altitude which are likely to be required. In its employment, care must be taken to enter the table at a place where the declination is appropriately named (of the same or opposite name to the latitude); it should also be noted that at the bottom of the last three pages values are given for the variation of a body at *lower* transit, which can only be observed when the declination and latitude are of the same name, and in which case the reduction to the meridian is subtractive; the limitations in this case are stated at the *foot* of the page, and apply to all values below the heavy rules.

TABLE 27: CHANGE OF ALTITUDE IN GIVEN TIME FROM MERIDIAN.

This table gives the product of the variation in altitude in one minute of a heavenly body near the meridian, by the square of the number of minutes. Values are given for every half minute between 0ᵐ 30ˢ and 26ᵐ 0ˢ, and for all variations likely to be employed in the method of "reduction to the meridian."

The formula for computing is:

$$\text{Red.} = a \cdot t^2,$$

where a = variation in one minute (Table 26), and

t = number of minutes (in units and tenths) from time of meridian passage.

The table is entered in the column of the nearest interval of time from meridian, and the value taken out corresponding to the value of a found from Table 26. The units and tenths are picked out separately and combined, each being corrected by interpolation for intermediate intervals of time.

The result is the amount to be applied to the observed altitude to reduce it to the meridian altitude, which is always to be added for upper transits and subtracted for lower.

TABLE 28, A, B, C, D: LATITUDE BY POLARIS.

[OMITTED.]

TABLES 29, 30, 31: CONVERSION TABLES.

These are self-explanatory.

TABLE 32: TRUE FORCE AND DIRECTION OF WIND.

This table enables an observer on board of a moving vessel to determine the true force and direction of the wind from its apparent force and direction. Enter the table with the apparent direction of the wind (number of points on the bow) and force (Beaufort scale) as arguments, and pick out the direction relatively to the ship's head and the force corresponding to the known speed of the ship.

EXAMPLE: A vessel steaming SE. at a speed of 15 knots appears to have a wind blowing from three points on the starboard bow with a force of 6, Beaufort scale. What is the true direction and force?

In the column headed 3 (meaning three points on bow, apparent direction) and in the line 6 (apparent force, Beaufort scale), we find abreast 15 (knots, speed of vessel) that the true direction is 5 points on starboard bow, *i. e.*, S. by W., and true force 4.

TABLE 33: VERTICAL ANGLES.

This table gives the distance of an object of known height by the vertical angle that it subtends at the position of the observer. It was computed by the formula:

$$\tan \alpha = \frac{h}{d},$$

where α = the vertical angle;
h = the height of the observed object in feet; and
d = the distance of the object, also converted into feet.

The employment of this method of finding distance is explained in article 139, chapter IV.

TABLE 34: HORIZON ANGLES.

This shows the distance in yards corresponding to any observed angle between an object and the sea horizon beyond, the observer being at a known height.

The method of use is explained in article 139, chapter IV.

TABLE 35: SPEED TABLE.

This table shows the rate of speed, in nautical miles per hour, of a vessel which traverses a measured mile in any given number of minutes and seconds. It is entered with the number of minutes at the top and the number of seconds at the side; under one and abreast the other is the number of knots of speed.

TABLE 36: LOCAL AND STANDARD TIMES.

This table contains the reduction to be applied to the local time to obtain the corresponding time at any other meridian whose time is adopted as a standard. The results are given to the nearest minute of time only; being intended for the reduction of such approximate quantities as the time of high water or time of sunset. More exact reductions, when required, may be made by Table 7.

TABLE 37: LOGARITHMS FOR EQUAL ALTITUDE SIGHTS.

[OMITTED.]

TABLE 37A: EQUATION OF EQUAL ALTITUDES NEAR NOON.

[OMITTED.]

TABLE 38: EFFECT UPON LONGITUDE OF ERROR IN LATITUDE.

Table 38 shows, approximately, the error in longitude in miles and tenths of a mile, occasioned by an error of one mile in the latitude.

Thus, when the sun's altitude is 30°, the latitude 30°, and the polar distance 100°, the error is eight-tenths of a mile.

The effect of an *increase* of latitude is as follows:

In *West* longitude, { East / West } of meridian, the { decreased / increased } longitude is { except where marked by *, when it is } { increased / decreased }.

In *East* longitude, { East / West } of meridian, the { increased / decreased } longitude is { except where marked by *, when it is } { decreased / increased }.

A *decrease* of latitude has the contrary effect.

The direction of error may readily be seen by drawing the Sumner line in a direction at right angles to the approximate bearing of the body.

TABLE 39: AMPLITUDES.

This table contains amplitudes of heavenly bodies, at rising and setting, for various latitudes and declinations, computed by the formula:

$$\text{sin amp.} = \text{sec Lat.} \times \text{sin dec.}$$

It is entered with the declination at the top and the latitude at the side.

Its use is explained in article 358, Chapter XIV.

TABLE 40: CORRECTION FOR AMPLITUDES.

This table gives a correction to be applied to the observed amplitude to counteract the vertical displacement due to refraction, parallax, and dip, when the body is observed with its center in the visible horizon.

The correction is to be applied for the sun, a planet, or a star, as follows:

At Rising in N. Lat. / Setting in S. Lat. } apply the correction to the right.

At Rising in S. Lat. / Setting in N. Lat. } apply the correction to the left.

For the moon, apply *half* the correction in the *contrary* manner.

TABLE 41: NATURAL SINES AND COSINES.

This table contains the natural sine and cosine for every minute of the quadrant, and is to be entered at the top or bottom with the degrees, and at the side marked M., with the minutes; the corresponding numbers will be the natural sine and cosine, respectively, observing that if the degrees are found at the top, the name sine, cosine, and M. must also be found at the top, and the contrary if the degrees are found at the bottom. It should be understood that all numbers given in the table should be divided by 100,000—that is, pointed off to contain five decimal places. Thus, .43366 is the natural sine of 25° 42′, or the cosine of 64° 18′.

In the outer columns of the margin are given tables of proportional parts, for the purpose of finding, approximately, by inspection, the proportional part corresponding to any number of seconds in the proposed angle, the seconds being found in the marginal column marked M., and the correction in the adjoining column. Thus, if we suppose that it were required to find the natural sine corresponding to 25° 42′ 19″, the difference of the sines of 25° 42′ and 25° 43′ is 26, being the same as at the top of the left-hand column of the table; and in this column, and opposite 19 in the column M., is the correction 8. *Adding* this to the above number .43366, because the numbers are *increasing*, we get .43374 for the sine of 25° 42′ 19″. In like manner, we find the cosine of the same angle to be .90108—4=.90104, using the right-hand columns, and *subtracting* because the numbers are *decreasing;* observing, however, that the number 14 at the top of this column varies 1 from the difference between the cosines of 25° 42′ and 25° 43′, which is only 13; so that the table may give in some cases a unit too much between the angles 25° 42′ and 25° 43′; but this is, in general, of but little importance, and when accuracy is required, the usual method of proportional parts is to be resorted to, using the actual tabular difference.

TABLE 42: LOGARITHMS OF NUMBERS.

This table, containing the common logarithms of numbers, was compared with Sherwin's, Hutton's, and Taylor's logarithms; its use is explained in an article on Logarithms in Appendix III.

TABLE 43: LOGARITHMS OF TRIGONOMETRIC FUNCTIONS, QUARTER POINTS.

This table contains the logarithms of the sines, tangents, etc., corresponding to points and quarter points of the compass. This was compared with Sherwin's, Hutton's, and Taylor's logarithms.

TABLE 44: LOGARITHMS OF TRIGONOMETRIC FUNCTIONS, DEGREES.

This table contains the common logarithms of the sines, tangents, secants, etc. It was compared with Sherwin's, Hutton's, and Taylor's tables. Two additional columns are given in this table, which are very convenient in finding the time from an altitude of the sun; also, three columns of proportional parts for seconds of space, and a small table at the bottom of each page for finding the proportional parts for seconds of time. The degrees are marked to 180°, which saves the trouble of subtracting the given angle from 180° when it exceeds 90°.

The use of this table is fully explained in Appendix III in an article on Logarithms.

TABLE 45: LOGARITHMIC AND NATURAL HAVERSINES.

The haversine is defined by the following relation:

$$\text{hav. } A=\tfrac{1}{2}\text{ vers. } A=\tfrac{1}{2}(1-\cos A)=\sin^2\tfrac{1}{2}A.$$

It is a trigonometric function which simplifies the solution of many problems in nautical astronomy as well as in plane trigonometry. To afford the maximum facility in carrying out the processes of solution, the values of the natural haversine and its logarithm are set down together in a single table for all values of angle ranging from 0° to 360°, expressed both in arc and in time.

TABLE 46: CORRECTIONS TO BE APPLIED IN ORDER TO FIND THE TRUE ALTITUDE OF A STAR AND ALSO OF THE SUN FROM THE OBSERVED ALTITUDE ABOVE THE HORIZON.

This is a consolidated table in which the tabulated correction for an observed altitude of a star combines the mean refraction and the dip, and that for an observed altitude of the sun's lower limb combines the mean refraction, the dip, the parallax, and the mean semidiameter, which is taken as 16′. A supplementary table at the foot of the main table takes account of the variation of the sun's semidiameter in the different months of the year.

TABLE 47: THE LONGITUDE FACTOR.

The change in longitude due to a change of 1′ in latitude, called the longitude factor, F, is given in this table at suitable intervals of latitude and azimuth. The quantities tabulated are computed from the formula—

$$F=\text{sec. Lat.}\times\text{cot. Az.}$$

When a time sight is solved with a dead-reckoning latitude, the resulting longitude is only true if the latitude be correct. This table, by setting forth the number of minutes of longitude due to each minute of error in latitude, gives the means of finding the correction to the longitude for any error that may subsequently be disclosed in the latitude used in the calculation.

Regarding the azimuth of the observed celestial body as less than 90° and as measured from either the North or the South point of the horizon towards East or West, the rule for determining whether the correction in longitude is to be applied to the eastward or to the westward will be as follows: If the change in latitude is of the same name as the first letter of the bearing, the change in longitude is of the contrary name to that of the second letter, and vice versa.

Thus, if the body bears S. 45° E. and the change in latitude is to the southward, the change in longitude will be to the westward; and, if the change in latitude is to the northward, the change in longitude will be to the eastward.

The convenient application of the longitude factor in finding the intersection of Sumner lines is explained in article 389.

TABLE 48: THE LATITUDE FACTOR.

The change in latitude due to a change of 1′ in the longitude, called the latitude factor, f, is given in this table at suitable intervals of latitude and azimuth. The quantities tabulated, being the reciprocals of the values of the longitude factor, are computed from the formula—

$$f=\frac{1}{F}=\frac{1}{\text{sec. Lat.}\times\text{cot. Az.}}=\text{cos. Lat.}\times\text{tan. Az.}$$

When an ex-meridian sight is solved with a longitude afterwards found to be in error, this table, by setting forth the number of minutes of latitude due to each 1′ of error in longitude, gives the means of finding the correction in the latitude for the amount of error in the longitude used in the calculation.

Regarding the azimuth of the observed celestial body as less than 90° and as measured from either the North or the South point of the horizon towards East or West, the rule for determining whether the correction in latitude is to be applied to the northward or to the southward is as follows: If the change in longitude is of the same name as the second letter of the bearing, the change in latitude is of the contrary name to the first letter, and vice versa. Thus, if the body bears S. 14° E. and the change in longitude is to the westward, the change in latitude will be to the southward, and, if the change in longitude is to the eastward, the change in latitude will be to the northward.

The convenient application of the latitude factor in finding the intersection of Sumner lines is explained in article 390.

NOTE.—When turning seconds of arc into time, and vice versa, it should be remembered that the fractions are sixtieths; thus, the value in time of 42″ is not 2ˢ.8, but 2$\frac{42}{60}$=2ˢ.8.

21634°—14—36

TABLE 11.

For reducing the Time of the Moon's passage over the Meridian of Greenwich to the Time of its passage over any other Meridian. The numbers taken from this Table are to be added to the Time at Greenwich in West Longitude, subtracted in East Longitude.

Longitude.	Daily variation of the moon's passing the meridian.													Longitude.

For finding the Variation of the Sun's Right Ascension or Declination, or of the Equation of Time, in any number of minutes of time, the Horary Motion being given at the top of the page in seconds, and the number of minutes of time in the side column. Also for finding the Variation of the Moon's Declination or Right Ascension in seconds of time, the motion in one minute being given at the top, and the numbers in the side column being taken for seconds.

TABLE 12.

For finding the Variation of the Sun's Right Ascension or Declination, or of the Equation of Time, in any number of minutes of time, the Horary Motion being given at the top of the page in seconds, and the number of minutes of time in the side column. Also for finding the Variation of the Moon's Declination or Right Ascension in seconds of time, the motion in one minute being given at the top, and the numbers in the side column being taken for seconds.

TABLE 12.

For finding the Variation of the Sun's Right Ascension or Declination, or of the Equation of Time, in any number of minutes of time, the Horary Motion being given at the top of the page in seconds, and the number of minutes of time in the side column. Also for finding the Variation of the Moon's Declination or Right Ascension in seconds of time, the motion in one minute being given at the top, and the numbers in the side column being taken for seconds.

TABLE 12.

For finding the Variation of the Sun's Right Ascension or Declination, or of the Equation of Time, in any number of minutes of time, the Horary Motion being given at the top of the page in seconds, and the number of minutes of time in the side column. Also for finding the Variation of the Moon's Declination or Right Ascension, in seconds of time, the motion in one minute being given at the top and the numbers in the side column being taken for seconds.

TABLE 12.

For finding the Variation of the Sun's Right Ascension or Declination, or of the Equation of Time, in any number of minutes of time, the Horary Motion being given at the top of the page in seconds, and the number of minutes of time in the side column. Also for finding the Variation of the Moon's Declination or Right Ascension in seconds of time, the motion in one minute being given at the top, and the numbers in the side column being taken for seconds.

For finding the Variation of the Sun's Right Ascension or Declination, or of the Equation of Time, in any number of minutes of time, the Horary Motion being given at the top of the page in seconds, and the number of minutes of time in the side column. Also for finding the Variation of the Moon's Declination or Right Ascension in seconds of time, the motion in one minute being given at the top, and the numbers in the side column being taken for seconds.

TABLE 12.

For finding the Variation of the Sun's Right Ascension, or Declination, or of the Equation of Time in any number of minutes of time, the Horary Motion being given at the top of the page in seconds, and the number of minutes of time in the side column. Also for finding the Variation of the Moon's Declination or Right Ascension in seconds of time, the motion in one minute being given at the top, and the numbers in the side column being taken for seconds.

TABLE 25.

Table showing the variation of the altitude of an object arising from a change of 100 seconds in the declination. Unmarked quantities in the Table are positive. If the change move the body toward the elevated pole, apply the correction to the altitude with the signs in the Table; otherwise, change the signs.

Declination.	Altitude.	Latitude of same name as declination.							Latitude of different name from declination.							Altitude.	Declination.

		Latitude of same name as declination.							Latitude of different name from declination.									

TABLE 25.

Table showing the variation of the altitude of an object arising from a change of 100 seconds in the declination. Unmarked quantities in the Table are positive. If the change move the body toward the elevated pole, apply the correction to the altitude with the signs in the Table; otherwise, change the signs.

Declination.	Altitude.	Latitude of same name as declination.							Latitude of different name from declination.							Altitude.	Declination.

TABLE 36.

Reduction of Local Mean Time to Standard Meridian Time, and the reverse.

[If local meridian is east of standard meridian, subtract from local mean time, or add to standard meridian time. If local meridian is west of standard meridian, add to local mean time, or subtract from standard meridian time.]

Difference of longitude between local meridian and standard meridian.	Reduction to be applied to local mean time.	Difference of longitude between local meridian and standard meridian.	Reduction to be applied to local mean time.

Additional Corr. for Sun's Alt.	1st to 15th....	+18	+15	+8	0	−8	−13	−14	−11	−5	+3	+11	+16
	16th to 31st...	+17	+12	+4	−4	−11	−14	−13	−9	−1	+7	+14	+18

* The corrections for the observed altitude of a Star or Planet involves the dip and the refraction; and for the observed altitude of the Sun's lower limb, the dip, refraction, parallax, and mean semidiameter, which is taken as 16′. A supplementary correction taking account of the variation of the Sun's semidiameter in the different months of the year is given at the foot of the main table.

TABLE 46.

Corrections to be Applied to the Observed Altitude of a Star or of the Sun's Lower Limb, to Find the True Altitude—Continued.

Variation of ☉ for Sun's ☉	+18	+15	+8	0	−8	−13	−14	−11	−5	+3	+11	+16
	+12	+5	0	11	−11	13	− 9	−1	+7	+14	+18	

* Increase the correction for the observed altitude if the ☉ is increasing, decrease if decreasing. Decrease the correction for the observed altitude if the ☉ is increasing, increase if decreasing. When the ☉ is taken on the ☉, a supplementary correction for the month of the year is given at the foot of the main table.

Corrections* to be Applied to the Observed Altitude of a Star or of the Sun's Lower Limb, to Find the True Altitude—Continued.

Additional Corr. for Sun's Alt.	Day of Month.	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.
		″	″	″	″	″	″	″	″	″	″	″	″
	1st to 15th....	+18	+15	+8	0	−8	−13	−14	−11	−5	+3	+11	+16
	16th to 31st...	+17	+12	+4	−4	−11	−14	−13	−9	−1	+7	+14	+18

* The corrections for the observed altitude of a Star or Planet involves the dip and the refraction; and for the observed altitude of the Sun's lower limb, the dip, refraction, parallax, and mean semidiameter, which is taken as 16′. A supplementary correction taking account of the variation of the Sun's semidiameter in the different months of the year is given at the foot of the main table.

TABLE 46.

Corrections to be Applied to the Observed Altitude of a Star or of the Sun's Lower Limb, to Find the True Altitude—Continued.

Day of Month.	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.
ADDITIONAL CORR. FOR SUN'S ALT.	″	″	″	″	″	″	″	″	″	″	″	″
1st to 15th	+18	+15	+8	0	−8	−13	−14	−11	−5	+3	+11	+16
16th to 31st	+17	+12	+1	−1	−11	−14	−13	−9	−1	+7	+11	+18

* The correction for the Sun's Lower Limb is the sum of a Star or Planet's correction for dip and the refraction; and for the observed altitude of the Sun's Upper Limb, the Lower Limb correction plus 32′, and Mean semi-diameter, which is taken as 16′. A supplementary correction for the Sun's semi-diameter in the different months of the year is given at the foot of the main table.

Corrections* to be Applied to the Observed Altitude of a Star or of the Sun's Lower Limb, to Find the True Altitude—Continued.

* The corrections for the observed altitude of a Star or Planet involves the dip and the refraction; and for the observed altitude of the Sun's lower limb, the dip, refraction, parallax, and mean semidiameter, which is taken as 16′. A supplementary correction taking account of the variation of the Sun's semidiameter in the different months of the year is given at the foot of the main table.

Add	−8	0	+8	+13	+14	+14	+13	+9	+4	−2
Subtract	+8	0	−8	−13	−14	−14	−13	−9	−4	+2

For Planets (Sun, Moon, and Stars) see page 1 of the refraction; and for the observed altitude (Sun's lower limb), Semi-diameter, which is taken as 16′. A supplementary correction for months of the year is given at the foot of the main table.

Corrections* to be Applied to the Observed Altitude of a Star or of the Sun's Lower Limb, to Find the True Altitude—Continued.

Obs. Alt.	HEIGHT OF THE EYE.											
	47 Feet.		48 Feet.		49 Feet.		50 Feet.		51 Feet.		52 Feet.

Additional Corr. for Sun's Alt.	Day of Month.	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.
		″	″	″	″	″	″	″	″	″	″	″	″
	1st to 15th....	+18	+15	+8	0	−8	−13	−14	−11	−5	+3	+11	+16
	16th to 31st...	+17	+12	+4	−4	−11	−14	−13	−9	−1	+7	+14	+18

* The corrections for the observed altitude of a Star or Planet involves the dip and the refraction; and for the observed altitude of the Sun's lower limb, the dip, refraction, parallax, and mean semidiameter, which is taken as 16′. A supplementary correction taking account of the variation of the Sun's semidiameter in the different months of the year is given at the foot of the main table.

TABLE 46.

Corrections* to be Applied to the Observed Altitude of a Star or of the Sun's Lower Limb, to Find the True Altitude—Continued.

Additional Corr. for Sun's Alt.	Day of Month.	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.
		″	″	″	″	″	″	″	″	″	″	″	″
	1st to 15th....	+18	+15	+8	0	− 8	−13	−14	−11	−5	+3	+11	+16
	16th to 31st...	+17	+12	+4	−4	−11	−14	−13	− 9	−1	+7	+14	+18

* The corrections for the observed altitude of a Star or Planet involves the dip and the refraction; and for the observed altitude of the Sun's lower limb, the dip, refraction, parallax, and mean semidiameter, which is taken as 16′. A supplementary correction taking account of the variation of the Sun's semidiameter in the different months of the year is given at the foot of the main table.

TABLE 46.

Corrections* to be Applied to the Observed Altitude of a Star or of the Sun's Lower Limb, to Find the True Altitude—Continued.

Observed Altitude	HEIGHT OF THE EYE.															
	62 Feet.		64 Feet.		67 Feet.		68 Feet.		69 Feet.		70 Feet.

Additional Corr. for Sun's Alt.	Day of Month.	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.
		″	″	″	″	″	″	″	″	″	″	″	″
	1st to 15th....	+18	+15	+8	0	− 8	−13	−14	−11	−5	+3	+11	+16
	16th to 31st...	+17	+12	+4	−4	−11	−14	−13	− 9	−1	+7	+14	+18

* The corrections for the observed altitude of a Star or Planet involves the dip and the refraction; and for the observed altitude of the Sun's lower limb, the dip, refraction, parallax, and mean semidiameter, which is taken as 16′. A supplementary correction taking account of the variation of the Sun's semidiameter in the different months of the year is given at the foot of the main table.

TABLE 46.

Corrections* to be Applied to the Observed Altitude of a Star or of the Sun's Lower Limb, to Find the True Altitude—Continued.

* The Sun's Corr. is to be applied to the observed altitude of the Sun's lower limb, and the Star's Corr. to the observed altitude of the Star, to find the true altitude; both are for the semi-diameter, which has been taken as 16′. A supplementary correction for the Sun's semi-diameter, which has been taken as 16′. A supplementary correction for the Sun's semi-diameter at any time or in the different months of the year is given at the foot of the main table.

Corrections* to be Applied to the Observed Altitude of a Star or of the Sun's Lower Limb, to Find the True Altitude—Continued.

Additional Corr. for Sun's Alt.	Day of Month.	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.
		″	″	″	″	″	″	″	″	″	″	″	″
	1st to 15th....	+18	+15	+8	0	−8	−13	−14	−11	−5	+3	+11	+16
	16th to 31st...	+17	+12	+4	−4	−11	−14	−13	−9	−1	+7	+14	+18

* The corrections for the observed altitude of a Star or Planet involves the dip and the refraction; and for the observed altitude of the Sun's lower limb, the dip, refraction, parallax, and mean semidiameter, which is taken as 16′. A supplementary correction taking account of the variation of the Sun's semidiameter in the different months of the year is given at the foot of the main table.
